                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 4069, Application US/09107532A
Patent No. 6583275
GENERAL INFORMATION:
APPLICANT: Lynn A Doucette-Stamm and David Bush
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
ENTEROCOCCUS FAECTUM FOR DIAGNOSTICS AND THERAPEUTICS
APPLICANT: Lynn A Doucette-Stamm and David Bush
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
ENTEROCOCCUS FAECIUM FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Pagenence No. 5594108

GENERAL INFORMATION:
APPLICANT: Van Tol, Hubert H.M.
APPLICANT: Civelli, Olivier
TITLE OF INVENTION: A No. 5594108el Human Dopamine Receptor and Uses
NUMBER OF SEQUENCES: 22
                                                                                                                                                                                                                                                                                                                                                                   Sequence 6, Application US/07928611

Patent No. 5569601

GENERAL INFORMATION:
APPLICANT: An Tol, Hubert H.M.
APPLICANT: Civelli, Olivier
TITLE OF INVENTION: A No. 5569601el Human Dopamine Receptor and Uses
TITLE OF INVENTION: A No. 5569601el Luman Dopamine Receptor and Uses
CORRESPONDENCES: 22
CORRESPONDENCES 12

STREET: Ald South Wacker Drive, Suite 3000
                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 24; DB 1; Length 37; Pred.                                                                                                                                                                                                                                                                         Sequence 8011, Application US/09328352

Patent No. 6562958

GENERAL INPORMATION:
APPLICANT: GATY L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REPRENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 8011
LENTH: 95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-07-626-618A-6

                                                                                                                                        Peptide H2 comprises amino acid residues 166-184 in the DEF box (I) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30502-03) of the DEF box are capable of antagonising the AAW30502-03) of the DEF box are capable of antagonising the cherodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing claimed are variants of these peptides, especially containing and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and and nost capable (see AAW30508), expression vectors cardiovascular cells, either in vivo or in vitro, e.g. for purging therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging treat or prevent restenosis in patients who have undergone treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding reagents as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Capable dis the use of sequences antisense to nucleic acide encoding (I)-(III) to control DP levels in cells, particularly by general and conting (I)-(III) enhance cell killing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                      Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.

Peptide H (I) comprises residues 163-199, i.e. the DEF box region, of transcription factor DP1. Claimed fragments (II) (see AAM30502-07) (c) of transcription factor DP1. Claimed fragments (II) (see AAM30502-07) (c) (II) are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are fusion proteins (I) or (III) and a membrane translocation sequence (III) comprising (I) or (III) and a membrane translocation sequence (see AAM30508), expression vectors encoding (I)-(III) and host cells. (c) specifically in tumour or cardiovascular cells, either in vivo or in specifically in tumour or cardiovascular cells, either in vivo or in c) (I)-(III) are used the respectively expression marrow. Surgical stents comprising or viro, e.g. for purging bone marrow. Surgical stents comprising control, e.g. for purging bone marrow. Surgical stents comprising control and an antagens who control by inactivating control in assays for the DNA-binding activity of DP/E2F dimerisation and as immunoassay controler and antagonists of DP-1/E2F dimerisation and as immunoassay controler capacide encoding (I)-(III) to control DP levels in cells, controler agents, AB profession (I)-(III) to control DP levels in cells, controlarly by gene therapy. When formulated with cytotoxic or cytostatic agents, (I)-(III) enhance cell killing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gapв
 Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          E2F activity inhibitors - for treatment and prevention of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

This represents a compound that can inhibit E2F activity. The compound also of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                     This represents a compound that can inhibit E2F activity. The compound also fethe formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylozarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or anino, and A is an B2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inhibitors - for treatment and prevention of tumours

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide HZmtl is based on peptide HZ (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. The HZmtl peptide, in which HZ residues corresponding to DP1 residues Val169 and Val175 are substituted by Ala residues, behaves in a similar fashion to the wild-type HZ peptide in its ability to inactivate EZF site DNA binding activity in D9 EC cell extracts. HZ is an antagonist of the heterodimerisation of DP1 with EZF. Thus, the Val-169 and Val-175 residues of HZ play little role in this activity. HZ and other claimed peptides (see AAW30504-07) from the DBF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. for the prevention of restenosis.

bp-1 transcription factor antagonist peptide H2mt2.

(6-0CT-1998 (first entry)

RESULT 6

쉽

```
Peptide HZmt3 is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. In HZmt3, amino acid residues of H2 that correspond to DP1 residues Leu173 and Leu176 are subscriptioned by Arg residues. H2 is an antagonist of the heterodimerisation of DP1 with E2F. H2mt3 has none of the antagonistic activity of H2. H2 and other calaimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tummour and cardiovascular cells, e.g. for the prevention of restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

                                                                                                                                                                                                                                                                                                                             Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                         Peptide HZmt2 is based on peptide H2 (see AAW30504) from the DEF bc (see AAW30501) of transcription factor DP1. In HZmt2, amino acid tresidues of H2 that correspond to DP1 residues Arg167 and Asp171 are substituted by Ala residues. H2 is an antagonist of the heterodimerisation of DP1 with E2F. H7mt2 retains some, but not all, of this antagonistic activity. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells,

```
Peptide H7 comprises amino acid residues 170-199 in the DEF box (I) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07) containing one or both of 2 motifs (see AAW30504-03) of the DEF box are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially concenting substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and and 175 of DP-1, fusion sequence (see AAW30508), expression vectors conceding (I)-(III) and host cells. (I)-(III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging C bone marrow. Surgical stens comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding cactivity of DP/E2F heterodimers. They are also used as research reagents, as positive controls in assays for identifying angagonists of DP-1/E2F dimerisation and as immunoassay agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           described is the use of sequences antisense to nucleic acids ding (I)-(III) to control DP levels in cells, particularly by therapy. When formulated with cytotoxic or cytostatic agents,
                  DP-1; transcription factor; antagonist, E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ⋧
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide H5 comprises amino acid residues 168-183 in the DEF box (II) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07) containing one or both of 2 motifs (see AAW30502-03) of the DEF box are capable of antagonising the AAW30502-03) of the DEF box are capable of antagonising the chercodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and a membrane translocation sequence (see AAW30508), expression vectors correctly (I) (III) and host cells. (I)-(III) are used to therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging treat or prevent restences in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding cactivity of DP/E2F heterodimers. They are also used as research reagents as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) to control by inactivating the DAM-binding caccides are controls in the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

Peptide H6 comprises amino acid residues 167-180 in the DEF box region (see AAM30501) of transcription factor DP1. Unlike claimed peptides (see AAM30504-07) that contain one or both of 2 motifs (see AAM30502-03) of the DP1 DEF box, peptide H6 is not capable of antagonising the heterodimerisation of a DP protein with an B2F protein. The claimed peptides, their variants and fusion proteins can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. to prevent restenosis.
                                                                                                                                                                                                                                                Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             E2F activity; inhibitor; treatment; tumour; arteriosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and alter plant cell proliferation characteristic such as to alter plant cell proliferation characteristic such as to alter plant cell, organ or tissue shape, and

                                                                            This represents a compound that can inhibit E2F activity. The compound alkanoyl, alloyl, hetero-arylcarbonyl, alloyl, arylcxycarbonyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, arylcxycarbonyl, hetero-arylcxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                    Gaps
                      E2F activity inhibitors - for treatment and prevention of tumours

                                                                                                                                                                                                                                                     This sequence represents 42% of the middle region of soybean cell cycle regulatory protein DP-1, as deduced from an isolated cycle regulatory protein DP-1, as deduced from an isolated come (see AAZ34579). The invention relates to nucleic acid fragments (see AAZ34575-8) encoding plant CDC-16, DP-1, DP-2 and E2F cell cycle regulatory proteins (see AAY32159-67). It also celates to the construction of a chimeric gene encoding all or a portion of the cell cycle regulatory protein, in sense or antisense orientation, where expression of the chimeric gene results in producton of altered levels of the cell cycle regulatory protein in consection for the construction of altered levels of the cell cycle regulatory protein in consection for the chimeric gene results in the sense constitutes studies of cell cycle regulation in plants, convide genetic tools to enhance cell growth in tissue culture, increase gene transfer efficiency and provide more stable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The proteins may also provide targets to and/or identification of cell cycle regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.

                                                                                                                                                                                                                                         셤
                                                                                                                         The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult

1 iver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high specification is ampleaded acid molecule expressed in the human adult stringency to a nucleic acid molecule expressed in the human adult claver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, is associated with coronary heart disease. ABG593910 represent hyperlipoprotechinaemia, hyperlipidaemia and hypercholesterolaemia which hyperlipoprotechinaemia, hyperlipidaemia of the invention.

3. Chuman liver single exon encoded peptides of the invention.

3. Chuman liver single exon encoded peptides of the invention.

3. Chuman liver supplementation for this patent does not appear in the norm with the legumence information for this patent does not appear in the liver wipo.int/pub/published_pct_sequences.

```
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human brain expressed single exon probe encoded protein SEQ ID NO: 35964.
                                                                          measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention provides a number of single exon nucleic acid

The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                     Peptide #10814 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human peptide encoded by genome-derived single exon probe SEQ ID 35546
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromacrosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary cillary dyskinesis; pulmonary hypertension; hyaline membrane disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
This sequence represents 10% of the middle region of soybean cell cycle regulatory protein B2F, as deduced from an isolated cell cycle regulatory protein B2F, as deduced from an isolated cell cycle regulatory proteins (see AAZ34583). The invention relates to nucleic acid fragments (see AAZ3455-83) encoding plant CDC-16, DP-1, DP-2 and E2F cell cycle regulatory protein, (see AAZ3159-67). It also relates to the construction of a chimeric gene encoding all or a relates to the construction of a chimeric gene results in correctation, where expression of the chimeric gene results in producton of altered levels of the cell cycle regulatory protein in producton of altered levels of the cell cycle regulatory protein in products a transformed host cell. The nucleic acids and proteins may be used to facilitate studies of cell cycle regulation in plants, increase gene transfer efficiency and provide nore stable transfer efficiency and provide targets to transformations. The proteins may also provide targets to transformations. The proteins may also provide targets to facilitate design and/or identification of cell cycle regulatory proteins that may be useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                  soybean; cell cycle regulatory protein; transcription factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61.5%; Score 56; DB 20; Length 80; ilarity 47.4%; Pred.                                                                                                                                                                                                                                                                                                         Peptide HI comprises amino acid residues 166-176 in the DEF box region (see AAW30501) of transcription factor DPI. Unlike claimed peptides (see AAW30504-07) that contain one or both of 2 motifs (see AAW30502-03) of the DPI DEF box, peptide HI is not capable of antagonising the heterodimerisation of a DP protein with an E2F protein. The claimed peptides, their variants and fusion proteins can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. to prevent restenosis.
                                                                                                                                                                                                                                                    Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

PT Polypoptide fragments of the DP-1 transcription factor - used for inducing apoptide fragments of the DP-1 transcription factor - used for dividing apoptide fragments of the DP-1 transcription factor DP-1 (all may apoptide).

Second of the DP-1 specifically in tumour and cardiovascular cells, No. 2 for preventing restenosis and cardiovascular cells and no process and cardiovascular cells and no process and cardiovascular cells and no process. The DP-1 cells and peptides (all Nava0502-03) of transcription factor DP-1 (all may person of the DP-1 by the DP-1 by the DP-1 cells and are variants of these peptides, especially containing and are variants of these peptides, especially containing and not 175 of DP-1, tusion proteins (III) comprising (I) (III) and host cells. (II) (III) are used conding (I) (III) and host cells. (IV) (III) are used conding (I) (III) and host cells. (IV) (III) are used conding (IV) (III) are used conding (IV) (III) function by inactivating the DRA-binding activity of DP-1 BZP binerisation and as ammunoassay agents. As an apparatus as positive controls in assays for identifying activity of DP-1 BZP dimerisation and as ammunoassay agents. As a positive controls in assays for identifying activity of DP-1 BZP dimerisation and as ammunoassay agents. As an acciding (I) (III) control DP lavels in cells, particularly by matches (III) control DP lavels in cells, particularly by matches (II) (III) enhance cell killing.

The present invention relates to a new method of modulating expression of telomerase reverse transcriptase (TERT) from a TERT expression system of telomerase a TERT promoter and a Site C repressor binding site. The method of the invention involves modulating TERT transcription repression to the Site C repressor binding site. The method of the invention is by the Site C repression of TERT for producing a mammalian cantibody. The method is also useful in a variety of different applications, including immortalisation of cells, production of reagents for use in life science research, therapeutic applications and characteric shortening and/or increasing TERT expression delays natural telomeric shortening and/or increasing TERT expression cally useful for treating disease conditions such as Progeria or the utchinson-Gilford syndrome, acquired immunodeficiency syndrome (AIDS), cardiovascular disease, osteoporosis, in skin rejuvenation and to inhibit immune senescence. The method can be employed to lengthen telomeres of osteoblast and osteodolast stem cells, encouraging bone replacement and proper remodeling and reinforcement, and can thus be used in bone marrow transplants and as such the method improves the survival and effectiveness of bone marrow are as such the method improves the survival and effectiveness of the method the method improves the survival and effectiveness of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               bone marrow and skin cell transplants. Decreasing TERT expression is useful for treating cellular proliferative disease conditions, including neoplastic disease conditions e.g. cancer. The present amino acid sequence represents the human DNA binding domain E2F-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Telomerase reverse transcriptase; TERT; Site C repressor; transcription;

                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to modulating expression of telomerase reverse transcriptase (TERT) expression system that includes a TERT promoter and a Site C repressor binding site. The method involves modulating TERT transcription repression by the Site C repressor binding site. The methods and compositions of the present invention are useful for the immortalization of cells, production of reagents in life science research, therapeutic agent screening applications, diagnosis and treatment of disorders associated with abserrant telomerase activity such as cancer, progeria, immune senescence, HIV, and in skin rejuvenation.
                                                                                                                                                                                                                                                                                                                 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                               Modulating expression of telomerase reverse transcriptase TERT by blocking repression of TERT transcription, useful for the diagnosis treatment of disorders associated with aberrant telomerase activity such as cancer and HIV -
cytostatic; immunostimulant; anti-HIV; vulnerary; telomerase; human; repressor protein; B2F-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a new method of modulating expression of telomerase reverse transcriptase (TERT) from a TERT expression system that includes a TERT promoter and a Site C repressor binding site. The method of the invention involves modulating TERT transcription repression by the Site C repressor binding site. The method of the invention is austinfor modulating expression of TERT for producing a mammalian antibody. The method is also useful in a variety of different applications, including immortalisation of cells, production of reagents for use in life science research, therapeutic applications, and therapeutic agent screening applications. Increasing TERT expression delays natural telomeric shortening and/or increases telomeric length and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     is useful for treating disease conditions such as Progeria or thuchinson-Gilford syndrome, acquired immunodeficiency syndrome (AIDS), cardiovascular disease, osteoporosis, in akin rejuvenation and to inhibit immune senescence. The method can be employed to lengthen telomeres of osteoblast and osteoclast stem cells, encouraging bone replacement and proper remodeling and reinforcement, and can thus be used in bone marrow transplants for the treatment of cancer and skin grafts for burn victims and as such the method improves the survival and effectiveness of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bone marrow and skin cell transplants. Decreasing TERT expression is useful for treating cellular proliferative disease conditions, including neoplastic disease conditions e.g. cancer. The present amino acid sequence represents the human DNA binding domain E2F-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modulating expression of telomerase reverse transcriptase (TERT) in a cell, for regulating proliferative capacity of a cell, involves modulating TERT transcription repression by Site C repressor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                        The invention relates to modulating expression of telomerase reverse transcriptase (TERT) expression system that includes a TERT promoter and a Site C repressor binding site. The method involves modulating TERT transcription repression by the Site C repressor binding site. The methods and compositions of the present invention are useful for the immortalization of cells, production of reagents in life science research, therapeutic agent screening applications, diagnosis and treatment of disorders associated with aberrant telomerase activity such as cancer, progeria, immune senescence, HIV, and in skin rejuvenation. The present sequence represents the DNA binding domain of a repressor protein E2F-4.
                                                                                                                                                                                      Modulating expression of telomerase reverse transcriptase TERT by blocking repression of TERT transcription, useful for the diagnosis and treatment of disorders associated with aberrant telomerase activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Wheat; transcription factor; TmE2F; plant retinoblastoma; plant E2F; Rb protein; cell cycle regulation; plant growth regulation; DNA replication; differentiation; E2F-derived peptide; DNA binding domain.

                                                                                                                                              The present sequence is a peptide comprising DNA-binding domain of wheat E2F protein that was identified in a wheat cDNA library by yeast two-hybrid screening. The E2F is a transcription factor that interacts with plant retinoblastom (Rb) and is involved in cell cycle regulation. The present sequence has the ability to bind to E2F binding site in plant DNA and is used to control plant growth, cellular DNA replication, cell cycle progression, differentiation and development by altering its DNA-binding

The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family demer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and
                                                                                                                                         This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted allangui, alloyl, hetero-arylcarbonyl, atkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             E2F activity inhibitors - for treatment and prevention of tumours and arteriosclerosis
B2F activity inhibitors - for treatment and prevention of tumours and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 E2F activity; inhibitor; treatment; tumour; arteriosclerosis.

                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel cell cycle protein (CCP) and the polynucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for medulating the cell polypeptide and an anti-CCP antibody is useful for medulating the cell of CCP in a sample. A CCP medulator is useful for medulating the cell of CCP in a sample. A CCP medulator is useful for medulating the cell of CCP in a sample of CCP medulator is useful as medulating the cell of CCP protein or production of CCP protein forms which have decreased or certain or production of CCP protein forms which have decreased or cell of CCP protein or production of CCP protein forms which have decreased or cell of CCP polypeptide are useful as herbicides or plant growth regulators. The polymucleotide is useful for medifying cell fate, plant development, cc farmulation or enhancement of cell division, DNA replication, promoction, stimulation and/or development, nodule function, dwarfism in plants.

Seed size, seed development, nodule function, dwarfism in plants, enescence, tolerance or resistance to stress. CCP, the polymucleotide is useful in agriculture to modulate the coll cycle and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to environmental conditions, including ablotic stress such as
                                                                               ö
                                                                                                                                                                                                                                                                                                       Cell cycle protein; CCP; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; nutrient deprivation; pathogen attack; crop yield; motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators -
